# Porous Materials And Their Structure

Introduction

Pore Structure

- Porosity
- Pore Cross-section
- Pore Shape
- Pore Size
- Pore Size Distribution
- Pore Path
- Pore Surface Area

Characteristics of Pore Structure

Characterization Techniques

Summary and Conclusion

# APPLICATIONS OF POROUS MATERIALS IN THE INDUSTRY

INDUSTRY	APPLICATIONS	ROLE OF POROUS STRUCTURE

# VARIOUS KINDS OF POROUS MATERIALS

## FIBROUS MATERIAL

Porosity due to voids between fibers

# VARIOUS KINDS OF POROUS MATERIALS

## POWDER BED

Porosity due to voids between particles and internal voids inside particles.

## CONSOLIDATED MATERIAL

Porosity in membrane created by voids left inside material

# VARIOUS KINDS OF POROUS MATERIALS

## COATED POROUS MATERIAL AND LAMINATED POROUS MATERIAL

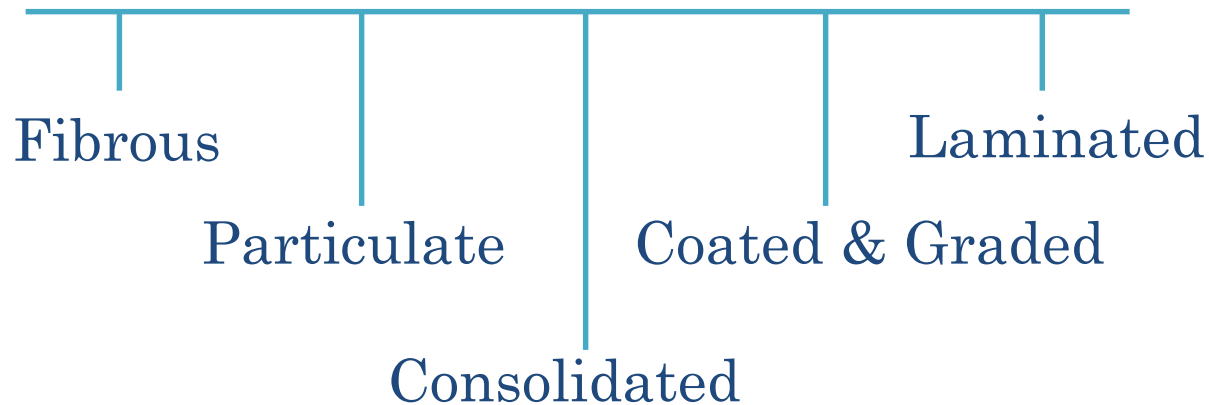

Structure of coated or laminated porous material.

# VARIOUS KINDS OF POROUS MATERIALS

## Structural classification of porous materials

### POROUS MATERIALS

# PORE STRUCTURE

POROSITY - Interstitial Void

High-resolution electron micrograph of the [110] plane of crystalline silicon showing interstitial openings in the plane of atoms

# PORE STRUCTURE

POROSITY - Interstitial Void

SILICON: Interstitial space 66 % of its volume

Arises because atoms cannot be compacted closer together due to strong repulsive forces resulting from overlap of outer electron orbitals.

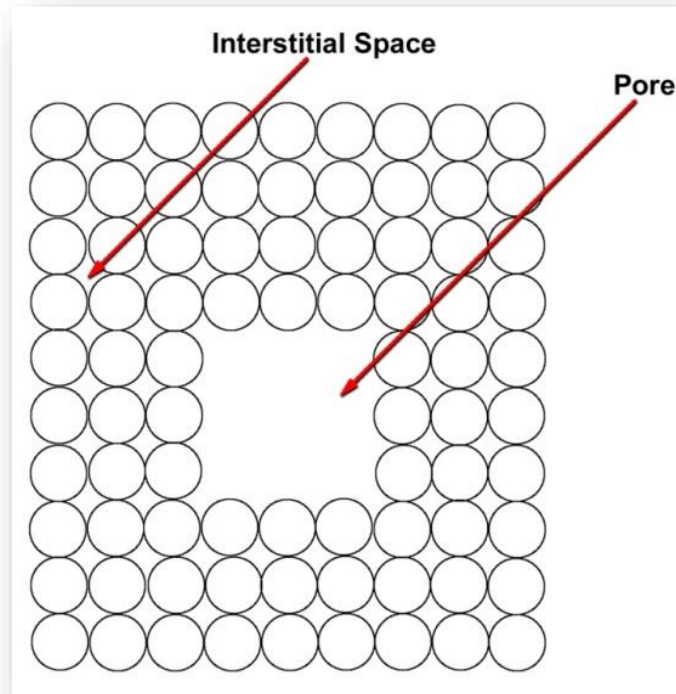

# PORE STRUCTURE

## POROSITY

### PORES

- Created by atoms missing from the neighboring lattice sites
- Porous materials contain pores and interstitial openings

# PORE STRUCTURE

## POROSITY

### DEFINITION OF POROSITY

Interstitial void volume in the solid ignored.  
Only pore volume considered

$$P = V_v / [V_v + V_s]$$

**P** = porosity

**V<sub>v</sub>** = volume of pores

**V<sub>s</sub>** = volume of solid in  
the material

⇔ Interstitial void Ignored

⇔ Pore Volume considered

# PORE STRUCTURE

## POROSITY

### WIDE RANGE OF POROSITY

Almost zero to very large

Large 5 mm size pore in ceramic foam

# PORE STRUCTURE

## POROSITY

Typical void size ranges and particle size ranges in some materials of interest.

# PORE STRUCTURE

## PORE CROSS-SECTION

Normally quite irregular

Sintered metal disc

Membrane

# PORE STRUCTURE

## PORE CROSS-SECTION

Circular in some unique materials

Track-etch membrane

# PORE STRUCTURE

## PORE SHAPE

Pores normally form highly interconnected and tortuous channels

High depth of focus reveals irregular cross-section and variation with depth

Tortuous channels in cross-section of membrane

# PORE STRUCTURE

## PORE SHAPE

Cylindrical pores without much interconnectivity in membranes can be produced by special techniques

Structure revealed by filling pores with insoluble material and dissolving the matrix

# PORE STRUCTURE

## PORE PATH

# PORE STRUCTURE

## PORE PATH

$$\tau = (l_c / l)$$

$\tau$  = tortuosity

$l$  = thickness of porous medium

$l_c$  = length of pore path

$$(\text{Flow Rate}) \propto [(D^4 \Delta p) / l_c]$$

Flow through tortuous path is less

# PORE STRUCTURE

## PORE SIZE

Varies along the course of the channel

**Pore size at any location determined by cross-section at that location**  
**Pores with irregular cross-sections: Pore size not defined**

# PORE STRUCTURE

## PORE SIZE

In all measurement techniques **pore diameter (D)** at the desired location in the pore is defined as the **diameter of an equivalent cylindrical pore**

# PORE STRUCTURE

## PORE SIZE

**Definition of measured pore size**

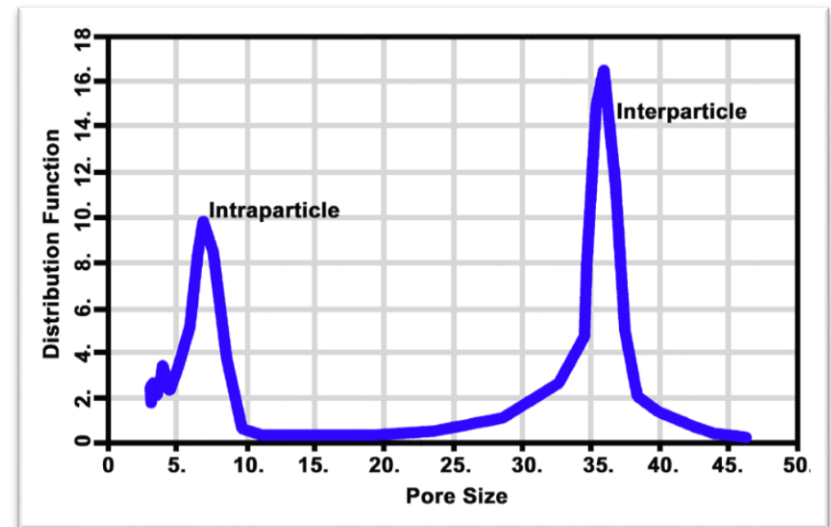

# PORE STRUCTURE

## PORE SIZE DISTRIBUTION

May be very narrow

May be broad

May be multi-modal

**Bimodal distribution in a powder bed**

# PORE STRUCTURE

## PORE SURFACE AREA

Pore surface area is determined by the:

- Shape of pore
- Size of pore
- Roughness of pore surface

Role of the three different kinds of pores

# PORE STRUCTURE

## PORE SURFACE AREA

**Envelope surface area**

# PORE STRUCTURE

## PORE VOLUME

The pore volume has the following components

Total pore volume

=

Volume of closed pores

+

Volume blind pores

+

Volume of through pores

# CHARACTERISTICS OF PORE STRUCTURE

Largest through pore *throat* diameter (bubble point pore diam): ***Barrier properties***

Mean flow through pore throat diameter: ***Measure of performance***

Pore size distribution: ***Measure of efficiency***

Gas permeability: ***Gas flow rate, Rate of Process***

Liquid permeability: ***Flow rate of liquid chemicals***

Pore volume & pore volume distribution: ***Dirt holding capacity***

Diffusion permeability: ***Small flow rates or leak rates***

Envelope surface area: ***Filtration***

Total surface area: ***Reaction rates***

# CHARACTERISTICS OF PORE STRUCTURE

## Simulation of true service conditions

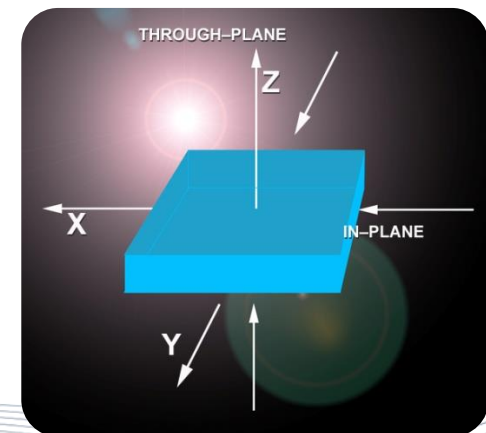

Effect of Compressive Stress

Effect of Cyclic Stress

Effect of Temperature

Effect of Chemical Environment (Use of different humidity and chemicals)

Effect of Orientation (Characteristics of in-plane pores and pores in the x & y directions)

# CHARACTERISTICS OF PORE STRUCTURE

## PORE CHARACTERISTICS OF GRADED, COATED & LAMINATED MATERIALS

### Graded pore structure in membrane

# CHARACTERIZATION TECHNIQUES

MACROSCOPIC MEASUREMENT TECHNIQUE - For large pores

MICROSCOPIC TECHNIQUES - Very few pores are measurable

PARTICLE CHALLENGE TECHNIQUE - Expensive & Time Consuming

**Particle challenge technique**

# CHARACTERIZATION TECHNIQUES

## CAPILLARY FLOW POROMETRY

- Measures differential gas pressure and flow rates through dry samples and samples wetted by a wetting liquid
- Computes through pore throat diameters, distribution and gas permeability
- Widely used & highly versatile

## PRINCIPLE OF CAPILLARY FLOW POROMETRY

# CHARACTERIZATION TECHNIQUES

## LIQUID - LIQUID POROMETRY

One immiscible high surface tension wetting liquid displaces from pores another low surface tension wetting liquid

Pore structure computed from measured

- Differential pressure
- Flow rate of wetting liquid with higher surface tension
- Interfacial tension between the two liquids

# CHARACTERIZATION TECHNIQUES

## CAPILLARY CONDENSATION FLOW POROMETRY

- Measures flow through pores not blocked by condensed vapor
- Computes through pore diameter, distribution and flow rate

# CHARACTERIZATION TECHNIQUES

## LIQUID EXTRUSION POROSIMETRY

- Measures differential gas pressure and volume of wetting liquid displaced from pores
- Computes through pore volume, diameter and distribution

# CHARACTERIZATION TECHNIQUES

## INTRUSION POROSIMETRY

- Increasing pressure forces non-wetting liquid in to pores
- Measures pressures and intrusion volume
- Computes pore volume and diameter

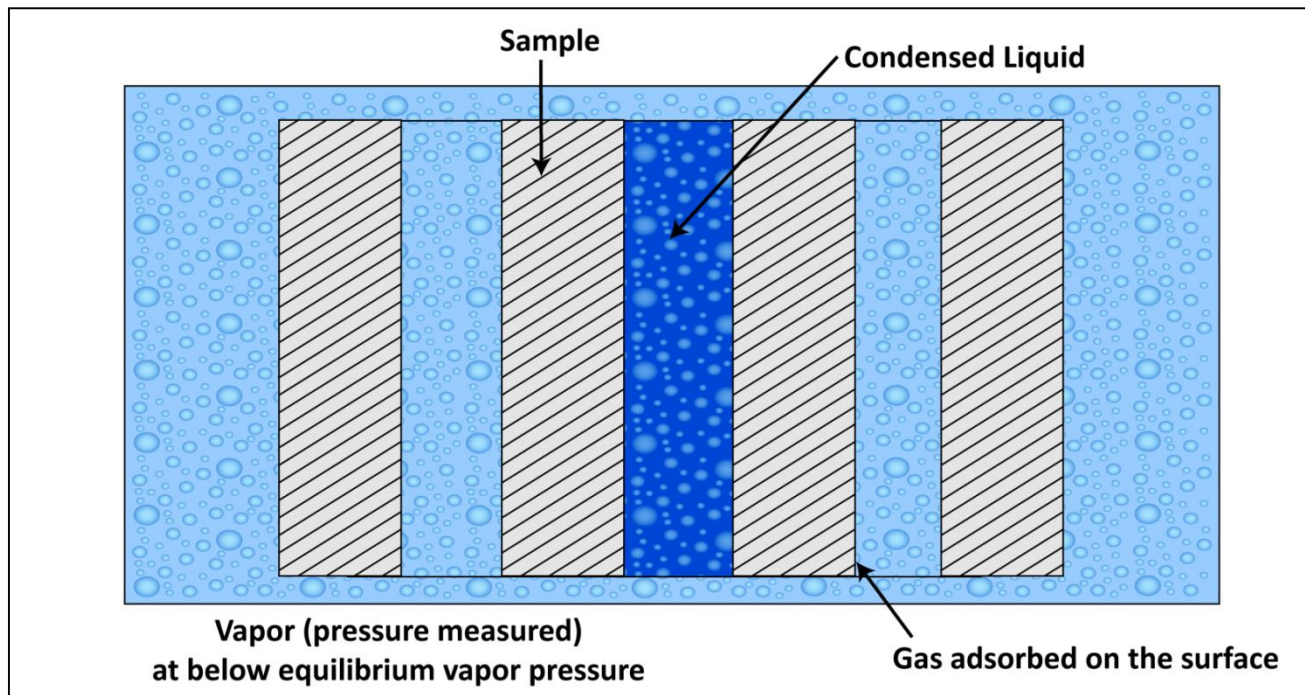

- Mercury (Mercury porosimetry)
- Water (Aquapore, Vacuapore)
- Other non-wetting liquids

# CHARACTERIZATION TECHNIQUES

## GAS ADSORPTION (BET) & CONDENSATION

- Measures surface area from amount of gas adsorption
- Measures pore volume and diameter from amount of gas condensation

PRINCIPLE OF THE GAS ADSORPTION TECHNIQUE

# CHARACTERIZATION TECHNIQUES

## NOVEL TECHNIQUES

### THERMOPOROMETRY

Measures freezing points of a liquid in pores having different diameters  
Pore diameter and distribution are computed

### GAS PERMEATION TECHNIQUE

- Measures flow rates of gases of differing molecular diameter
- Computes pore diameter and distribution

# CHARACTERIZATION TECHNIQUES

<b>Pore Structure Characteristics (Size, Volume, &amp; Distribution)</b>			
Size: > 500 $\mu\text{m}$	Size: < 500 $\mu\text{m}$	Size: 500 – 0.002 $\mu\text{m}$	Size: < 0.002 $\mu\text{m}$
1. Macroscopic techniques	1. Microscopy	1. Particle challenge	1. Capillary condensation flow porometry
		2. Flow porometry	2. . Liquid – Liquid porometry
		3. Extrusion porosimetry	3. Gas permeation porometry
		4. Gas adsorption	4. Thermoporometry
		5. Intrusion porosimetry	5. Gas adsorption
<b>Pore Structure Characteristics (Fluid Permeability, Porosity)</b>			
1. Gas/Vapor Permeametry			
2. Liquid Permeametry			
3. Pycnometry			

# SUMMARY

1. The pore structure is normally very complex. Characteristics must be carefully defined
2. Characteristics need to be measured:
  - Bubble point (largest pore size)
  - Mean flow pore size
  - Pore size distribution
  - Pore volume
  - Pore volume distribution
  - Liquid/gas permeability
  - Total surface area
  - Envelope surface area
3. A number of commercial techniques are available
4. The techniques, their capabilities, their limitations and all new developments will be critically examined in the following presentations

Thank You
